Copper and Brass Sales

Stainless Steel

thyssenkrupp

Service You Can Count On.

At thyssenkrupp Materials NA, Copper and Brass Sales, we're committed to being your best source for stainless steel. We maintain a large, diversified inventory to ensure quick delivery from any one of our North American locations, and offer superior precision processing so your order arrives in immediately usable condition.

Because of our extensive inventory and excellent service, we currently supply stainless steel to customers in a vast array of industries such as automotive, construction, food processing, chemical processing, aerospace, medical, oil and gas, and more.

Our sales representatives are always pleased to help you and furnish technical assistance to resolve your special application problems. Contact us today to learn how we can satisfy all of your stainless steel requirements.

Introduction to Stainless Steel

Stainless Steel Defined

Stainless steel came into being in the early 20th Century because of an urgent need for better materials. Chemical processing, oil refining, and other new manufacturing activities of the time were quickly surpassing the performance barriers imposed by conventional engineering materials.

It was an English metallurgist, Harry Brearley, who discovered stainless steel while searching for an improved alloy to protect cannon bores. He found that by adding chromium to low carbon steel, the steel became stain resistant. Further research showed that the protection mechanism that inhibited this rust was the formation of a microscopically-tight, self-healing, protective-oxide film on the surface of the metal.

This film has proven resistant to corrosives such as water, air, foods, and alkalis. The oxide is so thin and transparent that it escapes detection by the unaided eye. When scratched, nicked, or otherwise penetrated, a fresh film forms almost instantly on the exposed portion of the metal.

Stainless steel is defined today as a steel alloy containing at least 10% chromium, plus other elements — especially nickel. Generally speaking, stainless steel may be subdivided into four basic families:

Austenitic Family

Austenitic stainless steels are iron-chromium-nickel alloys which are hardenable only by cold working. Nickel is the main element varied within the alloys of this class while carbon is kept to low levels. The nickel content may be varied from about 4% to 22% — higher values of nickel are added to increase the ductility of the metal. When chromium is increased to raise the corrosion resistance of the metal, nickel must also be increased to maintain the austenitic structure.

These alloys are slightly magnetic in the cold-worked condition, but are essentially non-magnetic in the annealed condition in which they are most often used.

The austenitic types feature adaptability to cold forming, ease of welding, high-temperature service, and, in general, the highest corrosion resistance.

Austenitic Summary:
Hardenable by cold working
Medium to high strength
Non-magnetic
High resistance to corrosion
Contains nickel

Ferritic Family

Ferritic stainless steels are iron-chromium alloys which cannot be hardened significantly by heat treatment.

The ferritic types are intermediate in their ability to withstand corrosion. Increasing the amount of chromium raises the corrosion resistance of the metal. A chromium content of about 10% is necessary to ensure maximum corrosion resistance. Additional amounts of chromium (up to about 20%) are utilized to further increase the resistance of the metal to oxidation and scaling at elevated temperatures.

Ferritic types are highly resistant to atmospheric oxidation and strong oxidizing solutions. Qualities include adaptability to high-temperature, chemical, and outdoor use.

Ferritic stainless steels are magnetic in all conditions.

Ferritic Summary:
Not hardenable by heat treatment or cold working
Moderate strength
Magnetic
Low resistance to corrosion
Does not contain nickel

Martensitic Family

Martensitic stainless steels are iron-chromium alloys that contain from 10% to 18% chromium and can be hardened by heat treatment to high strength levels. Type 410 stainless steel is the basic alloy in this grouping. The martensitic types are the lowest in their ability to withstand corrosion.

Adding more carbon to the basic martensitic alloy increases hardness. But, as carbon is increased, chromium content is also increased to as high as 18% to maintain no less than 10% free chromium for corrosion resistance.

Other modified martensitic alloys contain additional elements, such as sulfur or selenium.

Martensitic varieties find major applications in products that must resist atmospheric oxidation, mildly corrosive chemicals, and wet or dry corrosion environments found in steam and gas turbine parts, bearings, and cutlery.

The martensitic types are magnetic in all conditions.

Martensitic Summary:
Hardenable by heat treatment
Magnetic
High strength
Moderate resistance to corrosion
Contains no nickel

Precipitation Hardening Family

This group of iron-chromium-nickel alloys has a corrosion resistance approaching that of the austenitic types and can be heat treated to high strength levels—approaching that of the hardenable martensitic types—through a special heat-treating cycle. (See the chart on page 8.)

Type 17-4 is normally supplied from the mill in the solution-heat-treated condition (Condition A) when fabrication calls for machining, welding, or cold forming prior to hardening.

The precipitation-hardening types are magnetic in the hardened condition.

Precipitation Hardening Summary:
Hardenable by heat treatment and aging
Medium to high strength
Magnetic
High resistance to corrosion
Contains nickel

Type Designations

Stainless steel alloys in North America are usually designated by one of two different numbering systems: the 3-Digit System and the U.N.S. Number System.

3-Digit System

In the traditional three-digit numbering system, the first digit indicates the series or group and the last two digits indicate the specific type. Modifications of the basic alloys are indicated by an alphabetic suffix to the series designation.

Series Groups

2XX Chromium-Nickel-Manganese Steels — Non-hardenable by heat treatment, austenitic, and non-magnetic hardenable by cold working.

3XX Chromium-Nickel Steels — Non-hardenable by heat treatment, austenitic, and non-magnetic hardenable by cold working.

4XX Chromium Steels — Hardenable by heat treatment, martensitic, and magnetic.

4XX Chromium Steels — Non-hardenable, ferritic, and magnetic.

5XX Chromium Steels — Low chromium, heat resisting. (Note: Although these alloys are sometimes associated with the stainless family, they are not true stainless steels as they only contain from 4% to 6% chromium.)

Note that the precipitation-hardening type alloys are not covered by the three-digit numbering system.

U.N.S. Number

A second numbering system, the Unified Numbering System (UNS), has more recently come into practice. This system had its origin in a cooperative effort of the American Society for Testing and Materials and the Society of Automotive Engineers. It is designed to designate each metal and alloy thereof by a unique five-digit number and alphabetic prefix. The prefix for Stainless Steel is "S."

Alloy Descriptions

Type No.	UNS No.	Group	Product Forms	Description
301	S30100	Austenitic	Sheet, Strip	High work-hardening rate due to reduced chromium and nickel content.
302	S30200	Austenitic	Bar	General purpose material with greater corrosion resistance but less work hardening than Type 301. This is the basic alloy of the austenitic group often referred to as 18:8.
303	S30300	Austenitic	Bar, Plate	Phosphorus and sulfur added for easier machining. For heavier cuts in automatic machining operations.
304	S30400	Austenitic	Bar, Sheet, Strip	Carbon lower to minimize carbide precipitation. Less heat sensitive than other 18:8 steels. Used in high-temperature applications.
304L	S30403	Austenitic	Bar, Sheet, Strip, Plate	Extra low carbon content to avoid harmful carbide precipitation in welding applications. Corrosion resistance comparable to Type 304.
316	S31600	Austenitic	Bar, Sheet, Plate	Contains molybdenum for better corrosion resistance—particularly to pitting.
316L	S31603	Austenitic	Bar, Plate	Carbon lower than Type 316 to avoid carbide precipitation in welding applications.
321	S32100	Austenitic	Bar, Sheet, Strip, Plate	Titanium added to avoid chromium-carbide precipitation when heated. Good for welding.
410	S41000	Martensitic	Bar	Basic martensitic type. General purpose, heat-treatable type used where corrosion is not severe.
410 HT	S41000	Martensitic	Bar	Heat treated version of Type 410. Basic martensitic type. General purpose, used where corrosion is not severe.
416	S41600	Martensitic	Bar	Free machining variation of Type 410 by virtue of added sulfur.
420	S42000	Martensitic	Bar	Hardenable stainless steel, which can be hardened to approximately Rockwell C 50.
430F	S43020	Martensitic	Bar	Free machining version of Type 430. Non-hardenable by thermal treatment and is used for heat resistance and corrosion resistance under many conditions. Excellent machinability and good forming.
440C	S44004	Martensitic	Bar	A high carbon type. Can be heat treated for high strength and hardness. Greater abrasion and wear resistance for use in bearing and bushing applications. Corrosion resistant only in the hardened condition.
15-5	S15500	Precipitation-Hardening	Bar	High strength, corrosion resistant and easy to heat treat. Use for high pressure applications.
17-4	S17400	Precipitation-Hardening	Bar, Plate	Chromium, nickel, copper, columbium, tantalum, and carbon balanced for high corrosion resistance and hardening by heat treatment.

Alloying Elements

Chromium — Most important element of stainless steel. An addition of 10% chromium will form an oxide film (passive surface film) which renders the steel corrosion resistant. Chromium also increases resistance to scaling.

Nickel — Second most important element. It increases ductility, corrosion resistance, scaling resistance, and high-temperature strength.

Silicon — Primarily increases resistance to scaling.

Manganese — Improves hot-working properties.

Molybdenum — Increases corrosion and high-temperature strength.

Sulfur-Phosphorus-Selenium — Increases machinability.

Titanium or Columbium-Tantalum — Stabilizes carbon and prevents chromium-carbide precipitation and subsequent intergranular corrosion.

Notes:

(1) Hardness shall not be the basis for rejection if tensile properties are acceptable determined on specimens taken from the same sample as that with non-conforming hardness or from another sample with similar non-conforming hardness.

(2) For sizes over 3 inches (76 mm), 35% for H900 condition and 38% for H925 condition.

(3) Temperature tolerance ±10 °F (±6 °C); time tolerance ±0.083 hour (±5 minutes); cool in air.

(4) Temperature tolerance ±10 °F (±6 °C); time tolerance ±0.25 hour (±15 minutes); cool in air.

(5) Maximum; alternate for wire -175 ksi (1207 MPa) maximum tensile strength.

(6) Temperature tolerance ±25 °F (±14 °C); time commensurate with thickness and equipment; cooled as required to below 90 °F (32 °C).

Machining Data

General Machining Guidelines

Premium machining grades of stainless steel contain small additives to improve the machinability by lubricating the cutting tool and producing non-clogging chips. As a result, tool life and cutting speeds are increased. The machining of stainless steels is best evaluated in actual production by the number of pieces having a satisfactory finish, within the required dimensional tolerances, that can be produced in a shift of a day with adequate tool life.

The following are essential practices for good machining of the stainless steels:

1. Maintain a high degree of rigidity in tools, tool holders, and equipment—no backlash.
2. Polish working faces of tools and keep cutting edges sharp.
3. Use a good lubricant or coolant in sufficient quantities. In most stainless steel machining it is more desirable to prevent heat from building up. High quality sulfur-base oils are usually used; however, soluble oils prove superior for clearing chips in deep drilling.
4. Use sufficient power to maintain constant speeds. Data on feeds and speeds are found below.
5. If equipment is sufficiently rigid, there is a great advantage in using high-speed steels or carbide tools. They permit significant increases in working speeds.
6. Milling cutters — use higher top rake angles, slower speeds.
7. Taps — keep them sharp. A 50% thread is preferred.
8. Reamers — for general work use a high speed, spiral-fluted reamer with 30 degrees lead or chamfer and mounted in a floating holder.
9. Drills — Use flatter angles such as 140 degrees instead of the conventional 118 degrees. Keep drills short and rigidly mounted. In general, drill speed will be about half that for mild steel.

Fabrication Properties

Type No.	UNS No.	Machinability*	Drawing or Stamping	Welding
301	S30100	40%	Good	Very good, tough welds.
302	S30200	40%	Good	Very good, tough welds.
303	S30300	70%	Fairly Good	Fusion welding not recommended.
304	S30400	45%	Very Good	Very good, tough welds.
304L	S30403	44%	Very Good	Very good, recommend for welding.
316	S31600	45%	Good	Very good, tough welds.
316L	S31603	45%	Good	Very good, recommended for welding.
321	S32100	38%	Good	Very good, tough welds.
410	S41000	60%	Fairly Good	Fair, pre-heat 400-500 °F. Anneal 1250 °F after welding.
416	S41600	85%	Fair	Poor, pre-heat 400-500 °F. Anneal 1250 °F after welding.
420	S42000	52%		
430F	S43020	85%		
440C	S44004	40%	Not Recommended	Not recommended.
17-4	S17400	40%		Very good, tough welds.

Machining Data

Machinability Ratings

Machinability ratings must be recognized as approximate values. They are a reasonable guide to relative tool life and power required for cutting. Variables of speed, cutting oil, feed, and depth of cut will significantly affect these ratios.

Type No.	Approximate SFM	% Relative Speed (Based on C1212 as 100%)	Machinability*

	1/8	135	0.0021	79	0.0016	190	0.002	75	0.0016
	1/4	145	0.0025	86	0.002	205	0.0024	81	0.002
	15 – 30		10 – 25		15 – 35		10 – 22		

Note: The data listed here are recommended starting points. Higher speeds and feeds may be obtainable based on the working environment. Keep in mind that speeds and feeds should always be adjusted in small steps. When using carbide tools; surface speed can be increased 2 to 3 times over the suggested values; feeds can be increased between 50 and 100%.

Stainless Steel Bar Finishes

Hot Rolled, Annealed and Pickled

These are bars that have been hot rolled to shape; they are not cold worked. These are sometimes called "true bars."

Hot Rolled, Annealed and Rough Turned

These are typically, large diameter bars (3 inches and larger). These bars are hot rolled or forged and then the OD is turned. All tolerances are on the plus (+) side. This is an excellent finish for customers who will be machining the bar OD in subsequent operations.

Cold Finished

Cold-finished bars are produced from hot-finished bars by additional operations at room temperature (cold finishing) to improve tolerances, surface finish, and mechanical properties. Because of their shape, cold-finished square, flat, hexagonal, octagonal, and special shape bars are produced from hot-finished bars, usually by cold rolling or cold drawing in straight lengths. When cold-finished bars are required to have higher strength and hardness, they are cold drawn or heat treated, depending upon the composition, cross section, and properties indicated. These bars, in the case of round sections, can subsequently be centerless ground, polished, or smooth turned to improve surface finish or tolerance. Cold drawing, smooth turning, and centerless grinding are all examples of cold finishing operations.

Cold Drawing

Rod, bar, or wire in straight lengths or in coil is pulled through a die to attain the desired diameter or shape.

Turning / Peeling

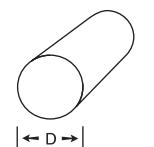

Sometimes called "peeling," this method removes material from the bar with a stationary cutting tool while the bar spins. This is a very cost effective process to cold finish material to commercial ASTM standards. Typically there is a slight spiral mark left by the tool down the length of the bar, but this can be burnished away if desired.

Centerless Grinding

Centerless grinding is an OD grinding process for long bars. It differs from other cylindrical processes in that the work piece is not mechanically constrained. Instead, the work piece is supported on its own outer diameter by an angular-top work rest blade located between a high-speed grinding wheel and a slower speed regulating wheel of smaller diameter. The angle of the work rest blade helps keep the work piece in contact with and under the control of the slower regulating wheel. Centerless grinding is able to actually improve the roundness of out-of-round bars. This makes it a popular pre-processing option for bars in many screw machine applications. Centerless grinding allows for very tight finish tolerances, typically ± 0.0005 inches.

Screw Machine Products

MAXX-imize consistency, machinability, and reliability, in production screw machine applications.

MAXX® Stainless Steel Bar

MAXX® Stainless Steel, only from Copper and Brass Sales, is optimized for chemistry, physical properties, and supply chain availability to MAXX-imize consistency, machinability, and reliability, in production screw machine applications. The result is a superior product that allows quality-focused customers to MAXX-imize their profits.

AccuMAXX® Bar for Swiss Machines

Next we took all of the high-quality attributes of our MAXX Stainless Steel Bar and customized it to meet the stringent requirements of the Swiss quality screw machine market.

AccuMAXX® offers:

- OD tolerance of ± 0.0005
- Tight concentricity
- .006/.008 total indicator reading (TIR)
- RMS finish of 25 max.
- 12 foot (+2, -0 inch) bar length
- Chamfered ends to reduce wear and tear on your collets
- $\frac{1}{2}$ commercial straightness

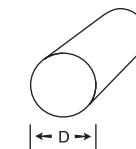

All of these attributes allow you to run your high-quality, tight tolerance Swiss machines to the MAXX.

Carpenter Project 70+®

The advanced chemistry, mechanical properties, and production practices offered by Carpenter Project 70+® satisfy the ultimate in difficult high-quality machining jobs. And Copper and Brass Sales is your exclusive source for this exceptional product.

Sheet Finishes

Distinctions are made in the finishes of stainless steel sheet by a system of numbers — the unpolished finishes being No. 1, No. 2D, and No. 2B; and the polished finishes being No. 3, No. 4, No. 6, No. 7, and No. 8.

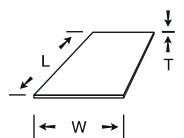

Sheets can be produced with one or two sides polished. When polished on one side only, the other side may be rough ground in order to obtain the necessary flatness.

No. 1 Finish	Hot-rolled, annealed, and descaled. Produced by hot rolling to specified thickness followed by annealing and descaling. Generally used in industrial applications, such as for heat or corrosion resistance, where smoothness of finish is not important.
No. 2D Finish	A dull, cold-rolled finish produced by cold rolling to the specified thickness, annealing, and descaling. The dull finish may be produced as a result of descaling or pickling operations or may be developed by a final, light cold-roll pass on dull rolls. This finish is favorable for the retention of oil on the surface in deep-drawing operations. This finish is generally used when forming deep-drawn articles which may be polished after fabrication.
No. 2B Finish	A bright, cold-rolled finish commonly produced in the same way as No. 2D except that the annealed and descaled sheet receives a final, light cold-roll pass on polished rolls. It is commonly used for all but exceptionally difficult deep-drawing applications and is more readily polished than a No. 1 or a No. 2D finish.
Bright Annealed Finish	A bright cold rolled highly reflective finish retained by final annealing in a controlled atmosphere furnace. The purpose of the atmosphere is to prevent scaling or oxidation during annealing. The atmosphere is usually comprised of either dry hydrogen or a mixture of dry hydrogen and dry nitrogen (sometime known as dissociated ammonia).
No. 3 Finish	This is a polished finish obtained with abrasives of approximately 100 grit. It is suitable for further polishing during fabrication operations.
No. 4 Finish	This is a general purpose finish widely used for restaurant and kitchen equipment, store fronts, etc. After initial grinding with coarse abrasives, sheets are further polished with abrasives of 120 to 150 grit.
No. 6 Finish	This is a dull satin finish having a lower reflectivity than that of No. 4 finish. It is produced by Tampico brushing of a No. 4 finish sheet in a medium of abrasive and oil. Its chief use is in architectural and ornamental applications where a high luster is not desirable.
No. 7 Finish	This finish has a high degree of reflectivity. It is produced by buffing an already finely ground surface, but the grit lines are left intact. It is also used for architectural and ornamental purposes.
No. 8 Finish	The most highly reflective finish that is commonly produced. It is obtained by polishing with successively finer abrasives and buffing extensively with very fine buffing rouges. This surface is free of grit lines from preliminary grinding operations. It is ideal for use as pressure plates, mirrors and reflectors, ferrotyping plates, etc. These sheets can be produced with one or both sides polished. In the case where only one side need be polished, the other side can be rough ground to obtain greater flatness.
TR Finish	The finish resulting from cold-working an annealed and descaled or bright-annealed product sufficiently to obtain mechanical properties higher than that normally obtained. Appearance will vary depending upon the amount of cold work required and the alloy ordered.

Weight Formulas

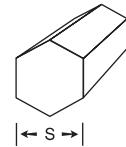

(All dimensions in inches unless otherwise noted. Use Density from table below.)

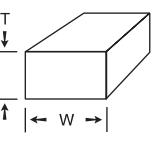

Round Rod:
 $(\text{Diameter})^2 \times 9.42 \times \text{Density} = \text{Weight per Lineal Foot (Pounds)}$

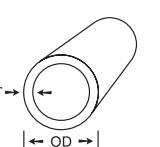

Square Bar:
 $(\text{Size})^2 \times 12 \times \text{Density} = \text{Weight per Lineal Foot (Pounds)}$

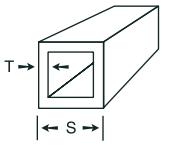

Hexagon Bar:
 $(\text{Size})^2 \times 10.4 \times \text{Density} = \text{Weight per Lineal Foot (Pounds)}$

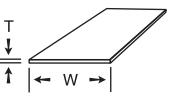

Rectangular Bar:
 $\text{Thickness} \times \text{Width} \times 12 \times \text{Density} = \text{Weight per Lineal Foot (Pounds)}$

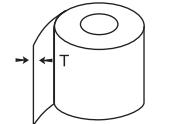

Round Tube:
 $(\text{Outer Diameter} - \text{Thickness}) \times \text{Thickness} \times 37.7 \times \text{Density} = \text{Weight per Lineal Foot (Pounds)}$

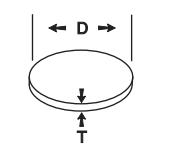

Square Tube:
 $1.27 \times \text{Round Tube of same Thickness and Outside Dimension} = \text{Weight per Lineal Foot (Pounds)}$

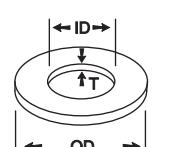

Sheet:
 $\text{Thickness} \times 144 \times \text{Density} = \text{Weight per Square Foot (Pounds)}$

Coil and Strip:
 $\text{Thickness} \times \text{Width} \times 12 \times \text{Density} = \text{Weight per Lineal Foot (Pounds)}$

Circles:
 $(\text{Diameter})^2 \times \text{Thickness} \times 0.785 \times \text{Density} = \text{Weight (Pounds)}$

Rings:
 $(\text{Outer Diameter} + \text{Inside Diameter}) \times (\text{Outer Diameter} - \text{Inside Diameter}) \times \text{Thickness} \times 0.785 \times \text{Density} = \text{Weight (Pounds)}$

Metal	Density (Pounds per Cubic Inch)

Take it to the MAXX®

When it comes to screw machine and high volume production applications, you can depend on MAXX® Stainless Steel to run better, run smoother, run longer and deliver more "parts to the pan." That's because MAXX® Stainless Steel is specially formulated with a controlled chemistry optimized for mechanical properties, surface finish, and consistent high quality — lot-to-lot, bar-to-bar and part-to-part.

With MAXX® Stainless Steel you are assured of MAXXimum Consistency for reduced set up time, MAXXimum Machinability for longer tool life, and MAXXimum Reliability for increased profits. And you can only get it from the materials experts at the Copper and Brass Sales Division.

And because it's from the Copper and Brass Sales, you'll also get the dependable delivery performance and peace of mind that comes from knowing that your supply chain is backed up by the global network of the thyssenKrupp group of companies.

MAXX® Stainless Steel is available in types 17-4, 303, 304/304L, & 316/316L

Sizes from $\frac{1}{4}$ " - 3" Round & $\frac{1}{4}$ " - 11/2" Hex
